

Method Attribute

The **method** attribute of the HTML **<form>** tag specifies the **HTTP** method that should be used when submitting the form data to the server. The two most commonly used methods are "**GET**" and "**POST**", but there are other methods that can be used as well.

Here are the possible values for the **method** attribute:

1. **GET**: This method is used to request data from the server. When a form is submitted using the "**GET**" method, the form data is appended to the URL query string.

Example: `<form method="GET" action="/search">`

2. **POST**: This method is used to submit data to the server. When a form is submitted using the "**POST**" method, the form data is sent in the HTTP request body.

Example: `<form method="POST" action="/submit-form">`

3. **PUT**: This method is used to update a resource on the server. The request body contains the updated representation of the resource.

Example: `<form method="PUT" action="/update-resource">`

4. **DELETE**: This method is used to delete a resource on the server.

Example: `<form method="DELETE" action="/delete-resource">`

5. **PATCH**: This method is used to update a resource on the server. The request body contains a set of instructions for how to update the resource.

Example: `<form method="PATCH" action="/update-resource">`
